

FRIGO 2000 NEW SURFACE COVERINGS IN RESIN

The refrigerator gets a new look

At Abitare il Tempo 2009, Frigo2000 S.r.l., in collaboration with Gobbetto resins,

has just presented some brand new resin finishes applied to General Electric and Sub-Zero refrigerators. These attractive and fun surface coverings confirm the experimental approach adopted by Gobbetto, a company offering resin application solutions with a high techno-

logical content, which are also able to express the language of art and communications in the research projects of architects, artists and designers.

So, starting from now, Frigo 2000 offers the most unusual and fun resin solutions, alongside the more traditional finishes of steel, aluminium and coloured metal sheet.

The creativity of the Mumble Mumble and Deco Lab artists, expressed in the plastic medium of resinous materials, has led to the experimentation of a new resin application on household

appliances. Conceived for any type of environment, resin coated doors may be personalised in a selection of different colours and materials such as: the Dega Art line and Flexint.

A coat of resin, whether transparent or coloured, which is processed by means of the most modern manufacturing techniques and then applied by hand. A unique and versatile idea that transforms and reinterprets the properties of this material with a modern and original slant, paving the

way to a vast expressive potential for applications in sectors that were once unthinkable ... for a total look in living environments! Totally customised refrigerator panels with Gobbetto resins are supplied exclusively by Frigo 2000 S.r.l.
